

NATURAL RESOURCES CONSERVATION SERVICE
CONSERVATION PRACTICE STANDARD
UPLAND WILDLIFE HABITAT MANAGEMENT
(Ac.)

CODE 645

DEFINITION

Provide and manage upland habitats and connectivity within the landscape for wildlife.

PURPOSE

Treating upland wildlife habitat concerns identified during the conservation planning process that enable movement, or provide shelter, cover, food in proper amounts, locations, and times to sustain wild animals that inhabit uplands during a portion of their life cycle.

CONDITIONS WHERE PRACTICE APPLIES

Land where the decision maker has identified an objective for conserving a wild animal species, guild, suite, or ecosystem.

Land within the range of targeted wildlife species and capable of supporting the desired habitat.

CRITERIA

General Criteria Applicable To All Purposes

A habitat evaluation or appraisal, approved by the Natural Resources Conservation Service (NRCS) state office, shall be used to identify habitat-limiting factors in the planning area. The Kansas Wildlife Habitat Appraisal Guide (KWHAG), Prairie Chicken Wildlife Habitat Evaluation Tool, or Kansas Biology Technical Note KS-33, Lesser and Greater Prairie Chicken, Bobwhite Quail, and Ring-necked Pheasant Assessment Worksheets will be used to determine if planning criteria is met.

Application of this practice shall remove or reduce limiting factor(s) in their order of significance, as indicated by results of the habitat evaluation.

Application of this practice alone, or in combination with other supporting and facilitating practices, shall result in a conservation system that will enable the planning area to meet or exceed the minimum planning criteria and considerations for wildlife habitat established in the national and state resource concerns and planning criteria found in Section III of the eFOTG.

Establish additional criteria for components of this practice including, but not limited to:

- Vegetation establishment for shelter, food, and to enable movement.
- Structural measures to provide shelter, food, or enable movement.
- Manipulation of vegetation to sustain desirable habitat conditions over time.

Seeding and planting specifications shall include only high quality and adapted species.

Site preparation, planting dates, and planting methods shall optimize vegetation survival and growth.

Equipment travel, grazing, haying, and other disturbance to habitat shall be restricted during critical periods such as nesting, brood rearing, fawning, or calving seasons. States may establish exceptions when certain disturbance causing activities are necessary to maintain the health of the plant community and control noxious weeds.

Control of regulated noxious weeds and invasive plants shall be specified.

CONSIDERATIONS

This practice may affect the target species as well as non-target species through mechanisms such as hunting, predation, disease transmission, or nest parasitism. Consider effects of this practice on species with declining populations.

Wildlife population control may be necessary to protect and maintain certain habitats. This is a responsibility of the landowner. State and federal regulations may apply to population control methods.

Undisturbed areas conserved at a sufficient extent during management activities, may sustain disturbance-intolerant animals and plants.

Other conservation practices that may be utilized in conjunction with this practice to create a wildlife management plan include:

- Forage and Biomass Planting (512)
- Early Successional Habitat Development/Management (647)
- Restoration and Management of Rare and Declining Habitats (643)
- Tree/Shrub Establishment (612)
- Range Planting (550)
- Prescribed Grazing (528)
- Prescribed Burning (338)
- Forage Harvest Management (511)
- Access Control (472)
- Riparian Forest Buffer (391)
- Riparian Herbaceous Cover (390)
- Forest Stand Improvement (666)

PLANS AND SPECIFICATIONS

NRCS shall ensure that plans and specifications for this practice are prepared by persons with adequate training in the fields of wildlife management, biology, or ecology.

Written specifications, schedules, and maps shall be prepared for each planning area and each habitat type.

Specifications shall:

- Identify the amounts and kinds of habitat elements, locations, and management actions necessary to achieve the client's management objectives.
- Describe the appropriate method, timing, and intensity of management needed to produce the desired habitat conditions and sustain them over time.

Specifications shall be transmitted to clients using NRCS approved specification sheets, job sheets, or fact sheets included in the conservation plan.

OPERATION AND MAINTENANCE

The following actions shall be carried out to ensure that this practice functions as intended throughout its expected life:

- Evaluate habitat conditions on a regular basis in order to adapt the conservation plan and schedule of implementation.
- Annually inspect and repair structural or vegetative components of this practice.
